SAMOS - Near Real Time MET and TSG Evaluation (Shawn)

History

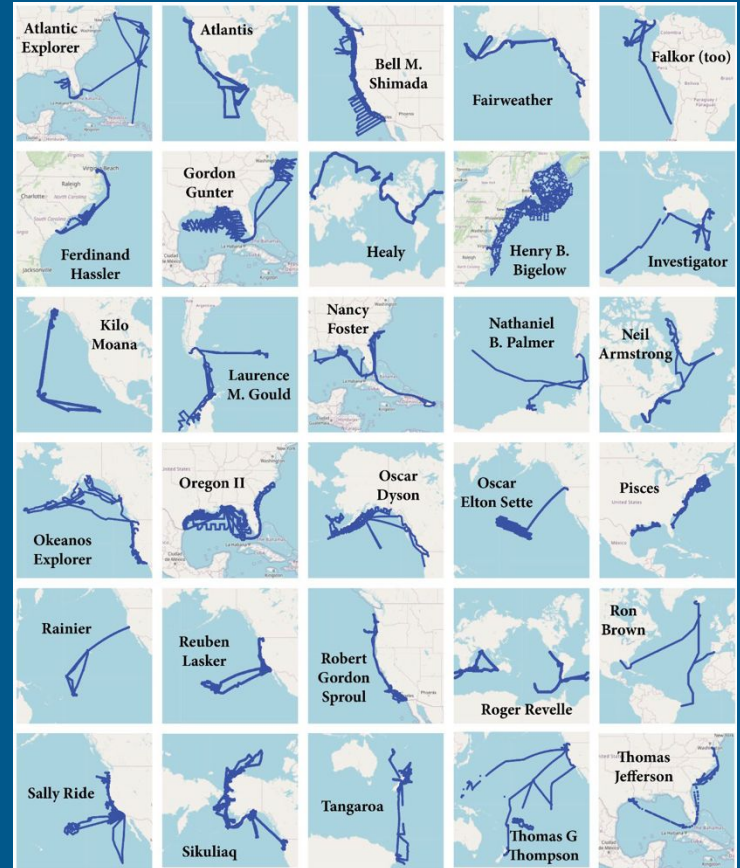

- Providing high-quality underway meteorological and oceanographic data from research vessels (RV) to the scientific community since 2005

Users

- Satellite algorithm developers
- Air-sea exchange (flux) researchers
- Ocean and atmosphere modelers
- Operational forecasters
- Geoinformatics, Ocean Best Practices

Status

- 30 vessels active in 2023
 - 2024: *Nuyina* added, *LM Gould* retired
- 9.23 million 1-minute data records processed in 2023
- Global coverage, concentrated around North America.

Coming Next

New proposal pending

- R2R and FAIR Principles
- Event Log Harvesting

Recommended Practices

R2R and FAIR Principles

Shawn Smith

Summary of Principles

- The Findability (F) principles focus on making data and digital resources discoverable.
 - To achieve this, **data should be assigned globally unique and persistent identifiers** (such as DOIs or URIs), **cataloged**, and **described using rich metadata** for search and discovery.
- The Accessibility (A) principles emphasize that data and digital resources should be **accessible with persistent metadata** through an **open, free, standardized communication protocol** that allows for authentication and authorization procedure when appropriate.

Reproduced from Peng, G., R. R. Downs, H. K. Ramapriyan, Y. Wei, B. Ramachandran, M. Parsons, Z. Liu, and NASA O'FAIR WG, 2024: A Practical Guide for Open, Free & FAIR NASA Earth Science Data Products. Document ID: NASA-OFAIR-ESDSWG-DOC-0002. Version: v00r05-20240614. CC0 1.0 + Attribution. <https://doi.org/10.5067/DOC/ESCO/ESDSWG-0002V1>

Summary of Principles

- The Interoperability (I) principles aim to facilitate seamless integration and exchange of data and digital resources across different systems, tools, services, and research domains.
 - To achieve this, it suggests that **data and digital resources should be structured using standardized and widely accepted data models, formats, and vocabularies**, including references to other relevant data and metadata, for example, a reference to utilized metadata standards.
- The Reusability or R principles promote the creation of data and digital resources that can be readily understood, interpreted, and (re)used.
 - This involves **adhering to domain-relevant standards** and **providing comprehensive data documentation**, including clear data usage license and detailed provenance.

Reproduced from Peng, G., R. R. Downs, H. K. Ramapriyan, Y. Wei, B. Ramachandran, M. Parsons, Z. Liu, and NASA O'FAIR WG, 2024: A Practical Guide for Open, Free & FAIR NASA Earth Science Data Products. Document ID: NASA-OFAIR-ESDSWG-DOC-0002. Version: v00r05-20240614. CC0 1.0 + Attribution. <https://doi.org/10.5067/DOC/ESCO/ESDSWG-0002V1>

R2R FAIR Status

- Findability

- R2R data packages (bags) include
 - Standard, machine readable metadata (DataCite formats)
 - Persistent identifiers (DataCite DOI)
 - Linked to well-curated R2R cruise catalog
 - Reciprocal links to other data repositories
- Cruise metadata also curated with DOIs
- R2R website supports schema.org metadata for discovery

- Accessibility

- Datasets are linked via URLs that resolve either to NCEI or R2R landing pages
- APIs supported by R2R are listed here <https://service.rvdata.us>

R2R FAIR Status

- Interoperability

- R2R has done a reasonably good job of using controlled vocabs for the metadata it generates (<https://www.rvdata.us/about/technical-details/vocabularies>) but **inside** the files things are often uncontrolled.
- Only some data sets/device types have defined data formats
- Multiple data acquisition system capture original device data in a variety of formats, sampling rates, etc.

- Reusability

- R2R uses Creative Commons CC0 license
 - Is this applicable/transferable when NCEI serves data submitted by R2R?
- Comprehensive dataset documentation is lacking or hard to identify for some datasets
- Domain-relevant standards may not exist.
- Data provenance not always clear between datasets and observing systems/devices

Proposed FAIR Activities

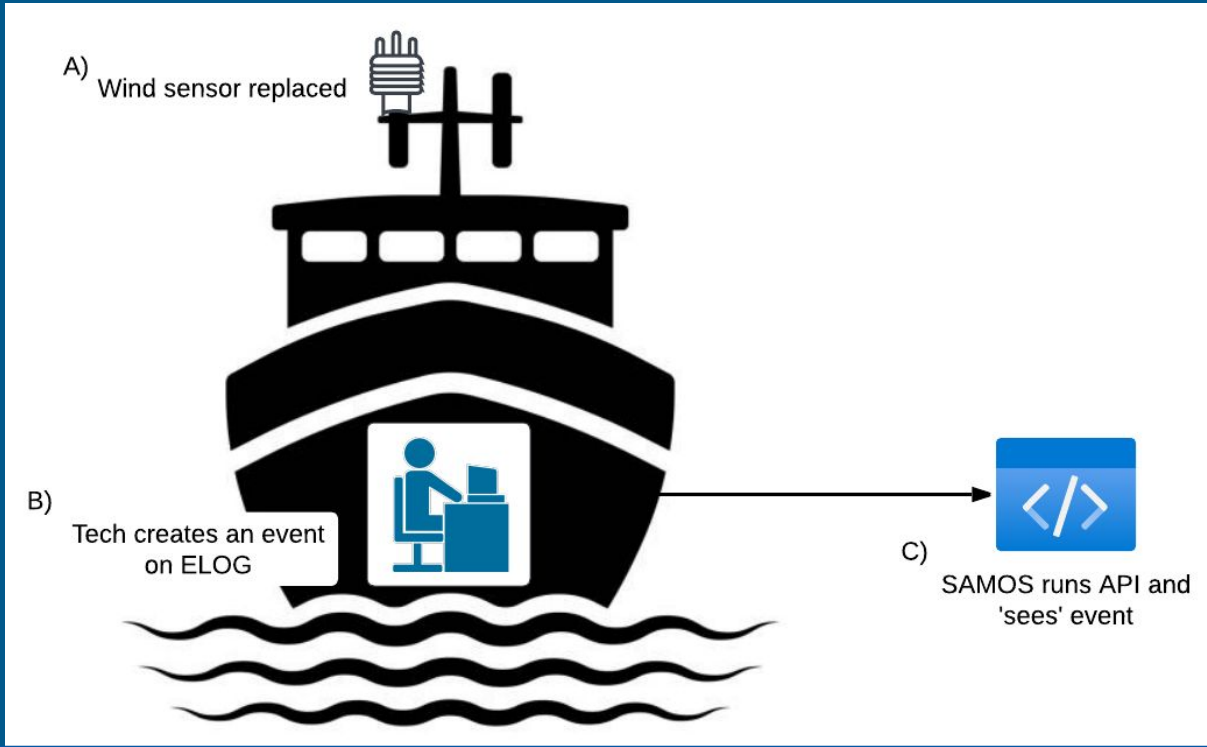

- R2R plans to move the ARF towards FAIR underway data collection, documentation, and distribution practices by establishing a FAIR data working group
- Composition of WG
 - R2R team members
 - Marine techs
 - Data managers and archivists
 - FAIR experts
- Charge to WG
 - Review existing FAIR implementation plans and procedures in the geosciences
 - Assess the FAIR readiness for ARF underway data using existing assessment tools
 - Develop device-specific plans moving the ARF towards FAIR at the time of data collection
 - Develop guidelines and protocols to align ARF underway data with documented principles.

Event Log Harvesting

Becca Hudak

Machine to Machine Harvesting of the R2R Eventlog

- The environmental sensor data streams collected during a cruise are of high value for later reuse, particularly as they contribute to building global syntheses and historical time series observations of ocean properties.
- M2M access to Eventlog data may allow SAMOS to
 - (a) maintain up-to-date metadata (e.g., sensor swaps, cal changes) and
 - (b) improve data flagging/QC by noting elog documented sensor failures or sensor impacting events (e.g., icing, roosting birds, etc).

Recommended Data Practices

George Dubinin, Gwynne Hayes

Timely Data Submission

- Our goal is to receive new cruise data distributions (distros) quarterly basis or more frequently.
- These data are important to science
- Timely data submission expedites distro ingestion and gives R2R more time to verify and validate network-transmitted data.

Avoiding Distro Updates

When we send data to an archive, like NCEI, they are difficult to modify

- It's much harder to update/change a distro than to add new files.
- If data already has been sent to NCEI this makes updates complicated. We prefer:
 - to serve data as-is and fill in gaps with documentation rather than manual changes
 - to receive the distros complete

Separating Oversize Filesets

- We would like to receive massive filesets (+1TB, eg SBP-29 & EK-80) as separate tarballs from the regular underway data.
- Please preserve the directory structure such that, if merged into the original distro, it would appear unmodified

Include cruise.md5deep Files

- Ensure that your distro contains a .md5deep file or an md5_summary.txt file
- Check that it has a plausible number of lines (not suspiciously truncated)
- Avoid skipping the generation of the md5 hashes
 - Files will often have a checksum resembling “*****” - the integrity of these files cannot be verified.

Safe and Effective File Naming

- It's helpful to have date strings in filenames. We use these strings to verify what date corresponds to which file.
 - Avoid Julian Day date/time as it interferes with our automated date checking processes.
- Don't put special characters in filenames.
 - *Seapath 330 User's Guide.pdf* <- this shouldn't have an apostrophe!!
 - *Knudsen comparison with SBP39_top line of Oceanus Z_W-bound_same line, same time.jpg* <- this shouldn't have commas or spaces

Standardizing the Directory Structure

By consolidating device formats you make it easier for us to maintain our mapping to ensure that we are picking up all useful data.

- Acquisition systems are a means of standardizing the directory structure for serial devices.
- Many of these perform other bookkeeping like enforcing valid filenames.
- Consistency helps us identify missing data.
- A standardized directory structure helps scientists who work across multiple vessels.

Network Transfers (Globus)

Our preferred network transfer method is Globus

- Globus performs checks on all transmitted data to ensure file integrity remains uncompromised.
- Pushing data to R2R's endpoint does not require a subscription.
 - If you are pushing a particularly large distro, please let us know first via info@rvdata.us beforehand!
 - We will help you with setting up Globus!
- Globus also ensures security of the transfer.

Data-Specific Asks

- Double-check for empty files i.e. not zero-byte but missing required data.
- Geophysical data: Include gravity ties and magnetometer layback in the distro to ensure R2R has current information for QA/DP.
 - Include documentation for devices in a top-level docs directory
- Confirm water column sonar data contains navigation.
 - Lack of navigation in wcd data creates downstream issues for NCEI archival.

Regularly Maintain Device Format Documentation

- R2R serves device data format documentation to the end user
 - The end user directly benefits from detailed and current device documentation
- R2R is looking to overhaul our system to work with these documents to introduce automation and checks on the data

Data Format Description:

The file contains GGA, VTG, and ZDA strings, alternating line-by-line, preceded by decimal unix system timestamps. Definitions follow.

Definition of Unix time:

Decimal seconds since 00:00:00 UTC - January 1, 1970 (minus leap seconds)

Definition of GGA:

GGA - essential fix data which provide 3D location and quality data.

Example Record: \$GPGGA,123519,4807.038,N,01131.000,E,1,08,*47

where:

GGA	Global Positioning System Fix Data
123519	Fix taken at 12:35:19 UTC
4807.038,N	Latitude 48 degrees 07.038 minutes North
01131.000,E	Longitude 11 degrees 31.000 minutes East
1	Fix quality: 0 = fix not available or invalid 1 = GPS Standard Positioning Service (SPS) mode, fix valid 2 = differential GPS (DGPS), SPS mode, fix valid 3 = GPS Precise Point Positioning (PPS) mode, fix valid
08	Number of satellites being tracked
*47	Checksum, always begins with *

Format Documentation Example

- High level description of the type of data
- Listing of the NMEA tags found in the data

- Short description for each NMEA tag about what its data describes

- Breakdown of what each column value in an example data line corresponds to

Data Format Description:
The file contains GGA, VTG, and ZDA strings, alternating line-by-line, preceded by decimal unix system timestamps. Definitions follow.

Definition of Unix time:

Decimal seconds since 00:00:00 UTC - January 1, 1970 (minus leap seconds)

Definition of GGA:

GGA - essential fix data which provide 3D location and quality data.

Example Record: \$GPGGA,123519,4807.038,N,01131.000,E,1,08,*47

where:

GGA	Global Positioning System Fix Data
123519	Fix taken at 12:35:19 UTC
4807.038,N	Latitude 48 degrees 07.038 minutes North
01131.000,E	Longitude 11 degrees 31.000 minutes East
1	Fix quality: 0 = fix not available or invalid 1 = GPS Standard Positioning Service (SPS) mode, fix valid 2 = differential GPS (DGPS), SPS mode, fix valid 3 = GPS Precise Point Positioning (PPS) mode, fix valid
08	Number of satellites being tracked
*47	Checksum, always begins with *

Definition of ZDA:

ZDA - Date and Time

Example Record: \$GPZDA,201530.18,04,07,2002,01,00*60

where:

201530.18	hours, minutes, and seconds expressed as <u>hhmmss.ss</u>
20	2-digit hour [24 hour clock]
15	2-digit minute
30.18	decimal seconds
04	2-digit day,
07	2-digit month
2002	4-digit year
01	2-digit local timezone hours: -13 to 13
00	2-digit local timezone minutes: 0 to 59
*60	Checksum, begins with *

Documentation Request List

- Md5deep checksum file for entire distro
- Magnetometer layback (usually part of the cruise-level metadata doc)
- Gravity ties (usually a PDF in the same directory as magnetometer layback)
- Format documents for all devices (in the format previously shown)

R2R Data Submission

For more information
refer to the Data
Submission page of
[rvdata.us](https://www.rvdata.us)

The screenshot shows the R2R website interface. At the top left is the R2R logo with the tagline 'ROLLING DECK TO REPOSITORY'. A navigation menu includes 'SEARCH', 'BROWSE VESSELS', 'DATA TYPES & PRODUCTS', 'COMMUNITY', and 'ABOUT R2R'. Below the navigation are three search boxes labeled 'Search cruise...', 'Search device...', and 'Search keyword...'. On the left sidebar, there are links for 'QA Dashboard', 'Operator Dashboard', 'API', 'Publications', and 'Best Practices'. The main content area is titled 'Data Submission' and includes a breadcrumb trail: 'Home / About / Data Policies & Repositories / Data Submission'. The section is titled 'Cruise, Vessel, and Device Information' and contains a paragraph explaining the R2R program. Below this is a section titled 'R2R needs the following information from vessel operators. :' followed by a bulleted list of requirements for data submission.

R2R Data Submission

Home / About / Data Policies & Repositories / Data Submission

Cruise, Vessel, and Device Information

The Rolling Deck to Repository program (R2R; [rvdata.us](https://www.rvdata.us)) provides shore-side data management for routine underway environmental sensor data collected on US academic research vessels. This work is a collaboration with vessel operators and chief scientists. The [Research Vessel Data Management Roles and Responsibilities](#) document gives a high-level description of the various operator, Chief Scientist and R2R responsibilities, whereas this document describes in detail how operators should provide their data to R2R.

R2R needs the following information from vessel operators. :

- A description of all standard underway devices onboard the vessel, including make, model, location and filenames of data in directory structure and data format description. R2R should be notified of any changes in equipment or data location before sending a cruise data distribution. Operators are encouraged to use the [standard directory structure](#) for cruise data developed by the R2R program and the operator community.
- The following minimum information to uniquely describe a cruise. R2R hopes to be able to harvest this information from the UNOLS MFP in the future, but we currently expect this data either as a [UNOLS/R2R Cruise Personnel Manifest](#) file or with the standard xml schema described at <https://schema.rvdata.us/>.
 - Vessel Name
 - Operating Institution Name
 - Cruise Identifier (cruise identifiers are unique within the R2R system - typically each vessel uses a unique prefix)
 - Start/End Ports and Dates

<https://www.rvdata.us/about/data-policies-and-repositories/data-submission>

R2R Best Practices

For more information
refer to the Best
Practices page of
rvdata.us

The screenshot shows the R2R website's 'Best Practices' page. At the top left is the R2R logo with the tagline 'ROLLING DECK TO REPOSITORY'. A navigation menu includes 'SEARCH', 'BROWSE VESSELS', 'DATA TYPES & PRODUCTS', 'COMMUNITY', and 'ABOUT R2R'. On the left side, there are search boxes for 'Search cruise...', 'Search device...', and 'Search keyword...', along with a sidebar menu containing 'QA Dashboard', 'Operator Dashboard', 'API', 'Publications', and 'Best Practices'. The main content area is titled 'Best Practices' and includes a breadcrumb 'Home / Best Practices'. The text explains that R2R encourages the use of community best practices and lists several categories: 'R2R-Developed Best Practices' (Cruise Data Directory Structure, Navigation Data Collection (PDF)), 'Community Best Practices' (Sensor Coordinate Systems, Underway Transmissometer Best Practices (PDF)), and 'Best Practice Development Efforts' (Flow Through Best Practice, CTD Best Practice, EK80 Best Practice). At the bottom, it mentions the Ocean Best Practices System (OBPS).

Questions for the Community:

- What is your biggest challenge when working with R2R?
- Is there any extra guidance that R2R can provide based on our requests?
Other ways we could help?
- Any other feedback?
