

# RECOMMENDED PRACTICES FOR SHIPBOARD RADIOMETERS

SHAWN R SMITH AND KATIE WATKINS-BRANDT

# ACKNOWLEDGEMENT:

Many of the following materials and recommendations developed by a panel of experts in marine and land-based radiation observation.

Riihimaki et al. 2024:

# WHY WE CARE!

- Focus here on shortwave (SW) and longwave (LW) radiometers
- Understanding atmosphere and ocean energy balance is key to weather forecasting, ocean process, chemical and aerosol cycles, and life on Earth
- Users
  - Air-sea flux community (energy exchange)
  - Satellite and model developers
  - Process studies (biological and chemical)

# Global Energy Flows $W m^{-2}$

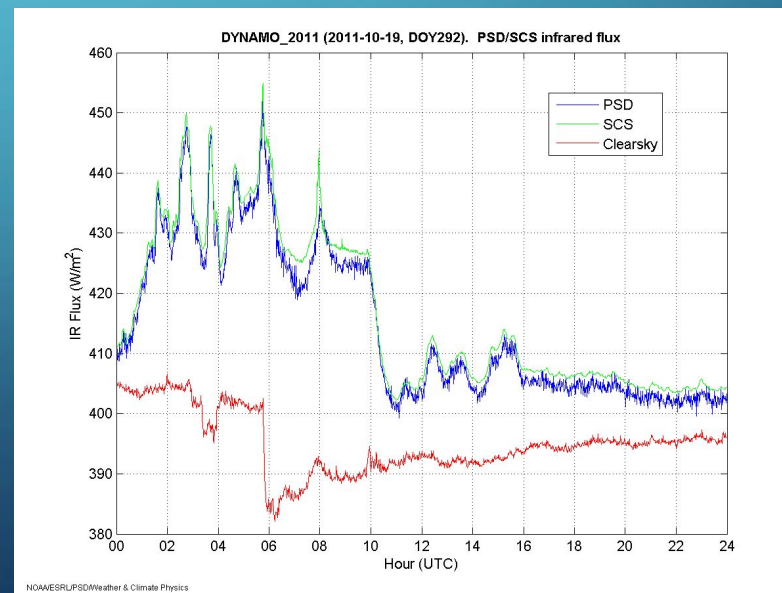

Kevin Trenberth, John Fasullo and Jeff Kiehl

# RADIATION OVER ONE DAY

SW

LW

# SENSOR SELECTION

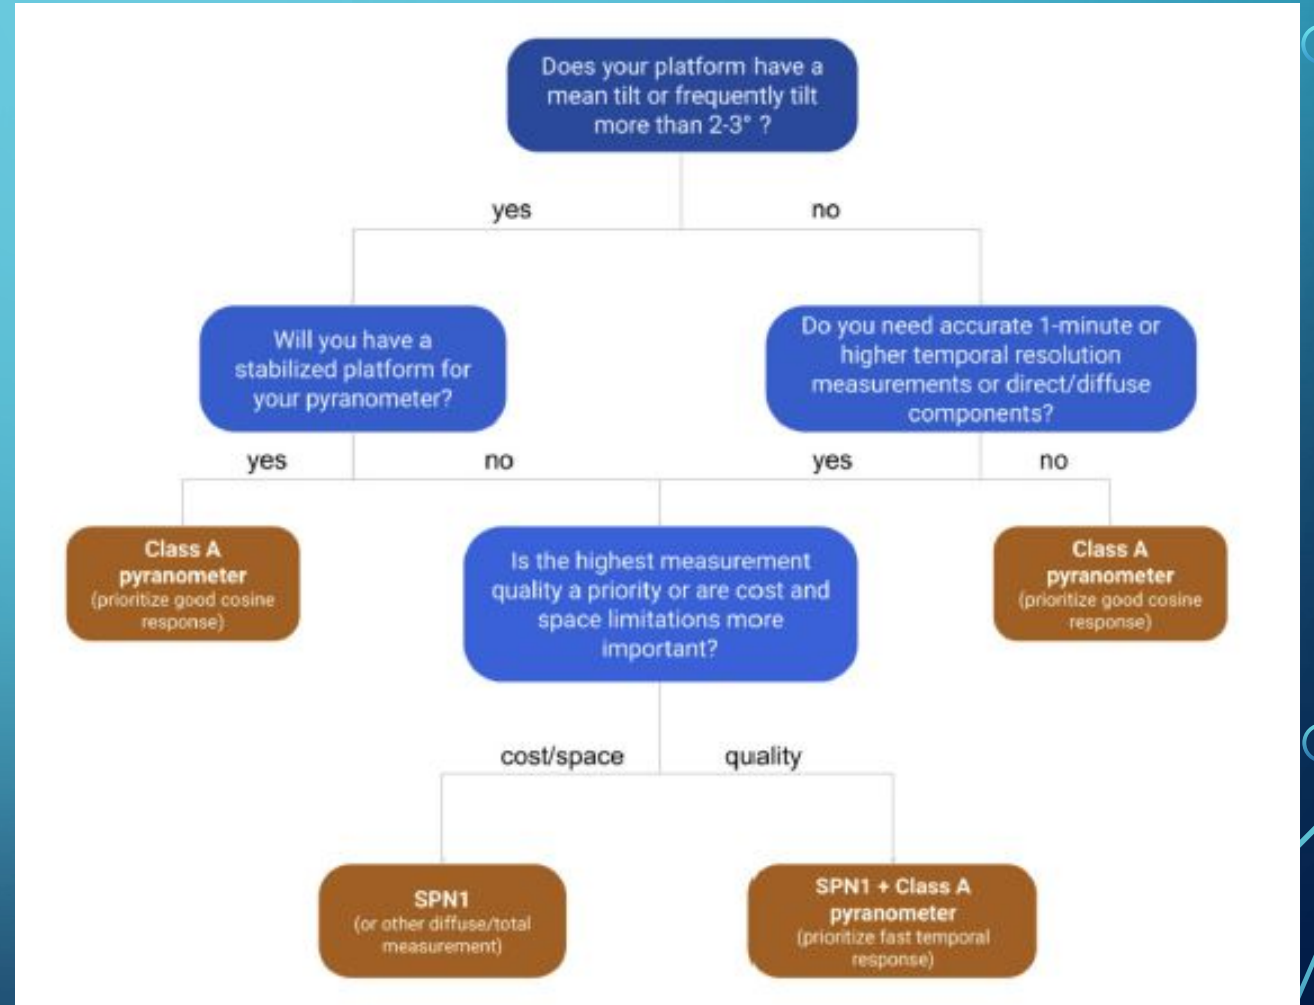

- What can we easily measure from RVs?
  - Direct SW incoming (downwelling)
    - Pyranometer
  - Diffuse SW (downwelling)
    - Ex. SPN1
  - LW incoming (downwelling)
    - Pyrgeometer
  - LW outgoing (upwelling)
    - IR SST sensor

# SENSOR SELECTION

- SW

- Review decision tree
- DeltaT, Kipp & Zonen, Hukseflux, EKO, Eppley
- Minimize thermal (IR) offsets
  - Ventilation helps
  - Corrections can be applied using LW data

# SENSOR SELECTION

- LW
  - Kipp & Zonen, Hukseflux, EKO, Eppley
  - Less industry standards
  - Ventilation helps reduce anomalous heating and debris build up
  - Nearby IR emitting structures can influence measurements

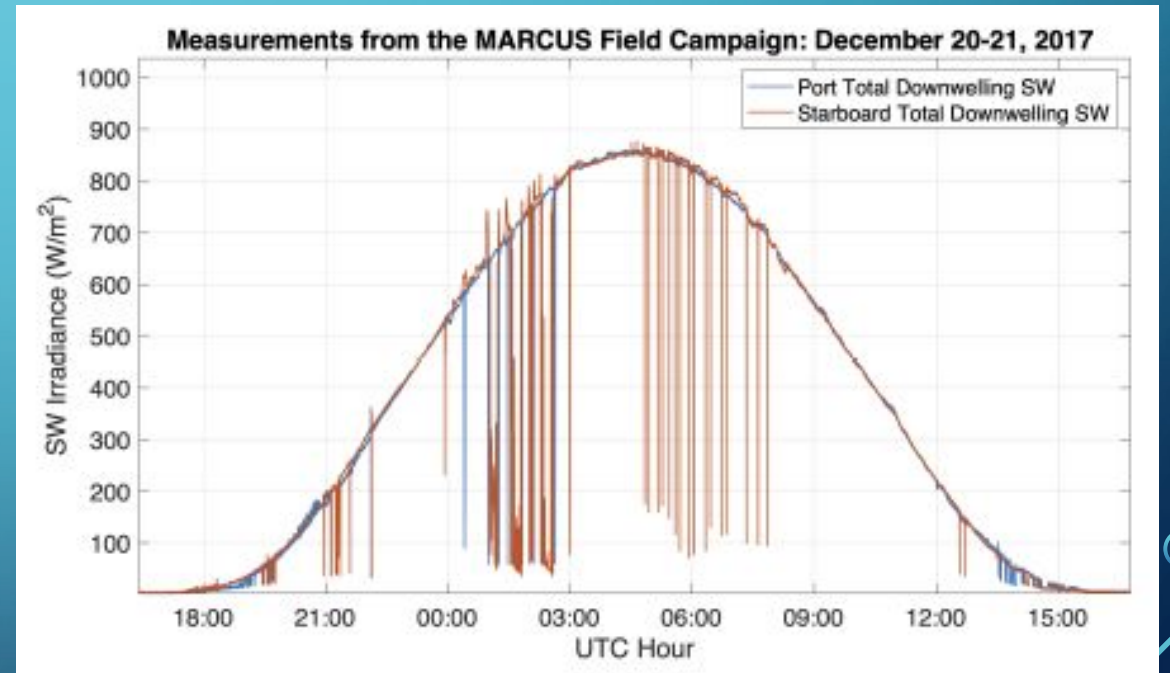

The background is a dark blue gradient. In the corners, there are decorative white line-art patterns resembling circuit boards or neural networks, with lines and small circles connecting them.

BREAK: HANDS ON TIME WITH RADIOMETERS

# LOCATION, LOCATION, LOCATION!

- Forward and high as possible to avoid shadows
- Forward of exhaust stacks
- Redundancy helps
- Leveling is important
  - Recording motion of vessel/platform supports tilt correction
  - Careful alignment with waterline removes “mean tilt” error
- Avoid EMI cloud

# LOCATION, LOCATION, LOCATION!

- Forward and high as possible to avoid shadows
- Forward of exhaust stacks
- Redundancy helps
- Leveling is important
  - Recording motion of vessel/platform supports tilt correction
  - Careful alignment with waterline removes “mean tilt” error
- Avoid EMI cloud

- Operational Reality: Location is a trade off between best location for measurement that provides good access for cleaning and maintenance.

# WHAT DATA TO RECORD?

- Full raw data sentences from sensor
  - Collect round the clock
  - These go to R2R post cruise
- Case/dome temps from some sensors help detect errors
- Sensor diagnostics (if available)
- Vessel motion at radiometer sampling rate (1Hz recommended for both)

## Essential measurements:

- LW, SW irradiance ( $\text{Wm}^{-2}$ )
- Raw Thermopile voltage ( $\mu\text{V}$ )
- Any available thermistor temperatures ( $^{\circ}\text{C}$  or  $^{\circ}\text{K}$ )
- Thermopile calibration values ( $\mu\text{V}/\text{Wm}^{-2}$ )

# WHAT METADATA TO RECORD?

- Serial numbers
- Calibration values and history
- Log of problems, cleanings, maintenance, repairs, etc.
- Installation location, photos of sensor and 360° field of view for sensor
- Existence of bird deterrence or ventilation

# MAINTENANCE

- Shipping – pack to avoid damage
- Desiccants – Weekly or as often as possible
- Check ventilation, cables, connectors
- Cleaning
  - Recommended: Daily, prior to dawn
  - Minimum: Weekly
  - Practical: As often as possible, but at least before and after each cruise.

*Photograph of Eppley PIR pyrometers with broken domes from improper packing when shipping. Photo credit L. Riihimaki*

The background is a solid teal color. In the four corners, there are decorative white line-art patterns resembling circuit board traces and nodes. The top-left and bottom-left patterns are more dense and vertical, while the top-right and bottom-right patterns are more sparse and horizontal.

# BREAK: RADIOMETER CLEANING/MAINTENANCE DEMO

DOCUMENTATION

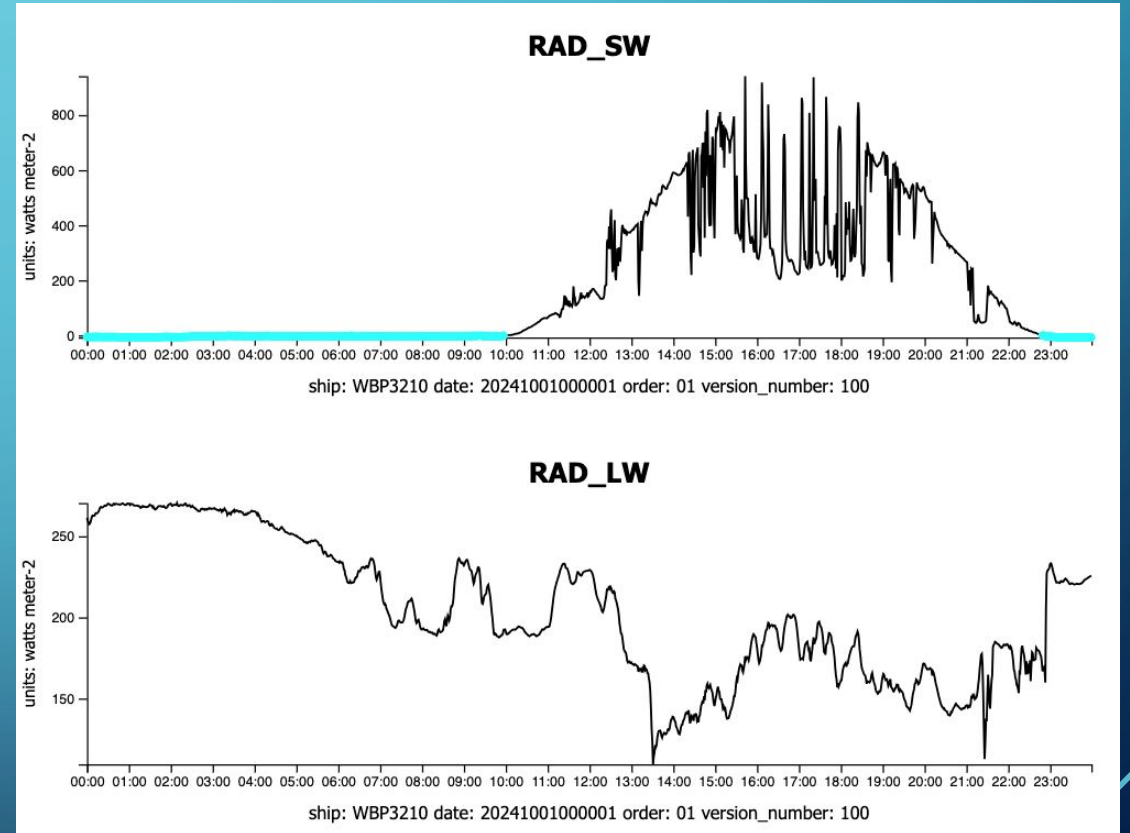

# CALIBRATION

- At least every 1-2 years
- Generally done by manufacturer
  - Can operators leverage regional centers?
- Facility should calibrate to available standards
  - SW – Traceable to World Radiometric Reference
  - LW – Traceable to World Infrared Standards Group
- Shipboard radiometer community still developing standard calibration procedures

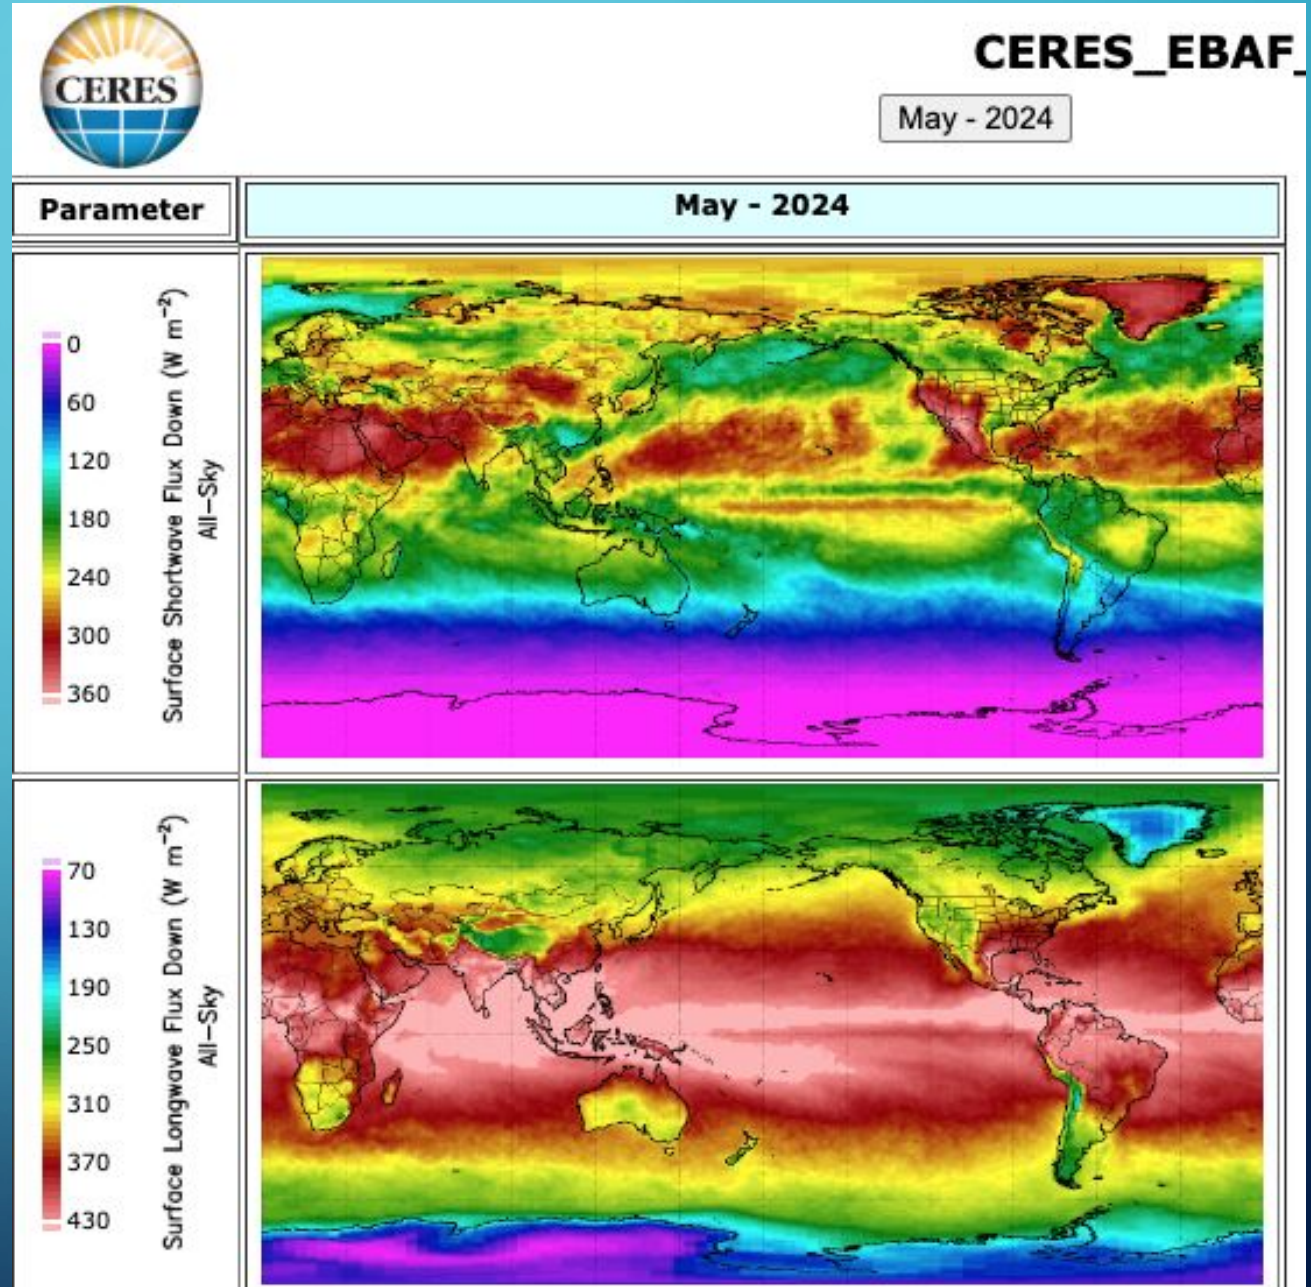

# MONITORING

- Verify nighttime offsets for SW sensors
  - No more than a few  $\text{Wm}^{-2}$  for newer pyranometers
  - Up to  $10 \text{ Wm}^{-2}$  for older Eppley PSP
- Plausible data ranges:
  - SW
    - $0 - 1200 \text{ Wm}^{-2}$ , up to  $1500 \text{ Wm}^{-2}$  on partly cloudy days
  - LW
    - $40 - 700 \text{ Wm}^{-2}$
    - Higher in tropics, presence of low clouds

# MONITORING

- Compare to climatology
- Monthly: CERES\_EBAF\_Ed4.2
  - <https://ceres-tool.larc.nasa.gov/ord-tool/jsp/EBAF42Selection.jsp>
- Daily: CERES\_SYN1deg\_Ed4.1
  - <https://ceres-tool.larc.nasa.gov/ord-tool/jsp/SYN1degEd41Selection.jsp>

The background is a dark blue gradient. In the corners, there are decorative white and light blue lines that resemble a circuit board or data paths, with small circles at the end of the lines.

# EXAMPLES OF SUSPECT DATA

# UNDERSTANDING DATA MESSAGES

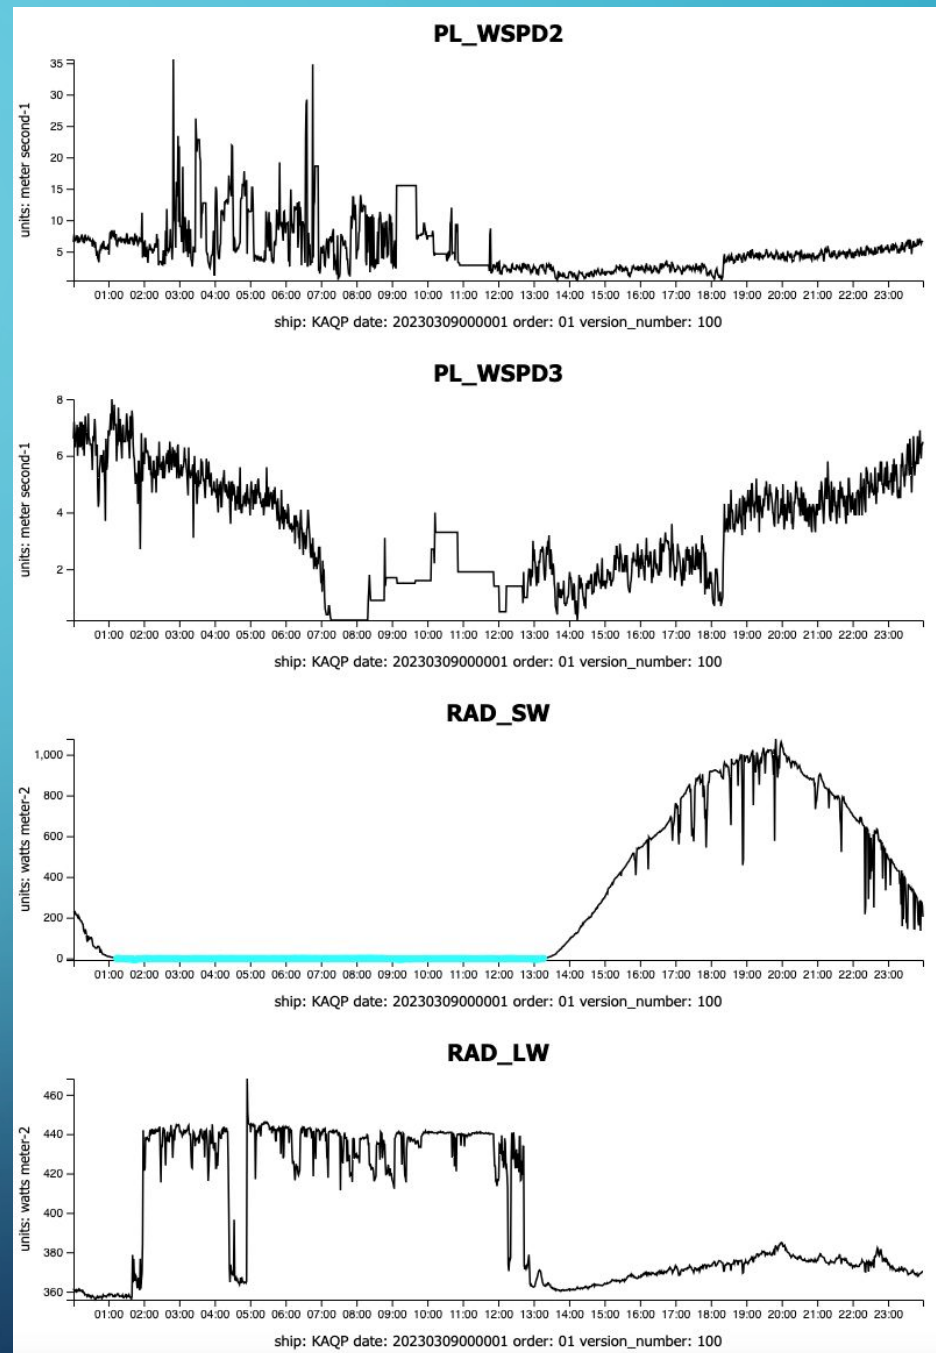

- Negative long wave radiation data (physically unrealistic)
- Examination of data messages revealed a temperature issue:  
`$WIR35,23/03/17,00:10:30, 176, -13.2, -712.82, 28.04, 67.12, -0.88, 34.0, 11.5`
  - PIR case temperature = 28.04 °C
  - PIR dome temperature = 67.12 °C
  - dome and case temperatures usually about the same

# ARTIFICIAL LIGHT SOURCES

- SW should be near zero at night
- Sometimes bright lights in a port or from trawling operations appear in data.
- This would be a case where a note in an electronic log would be helpful.

# BIRD IS THE WORD!

# QUESTIONS
